

Celerant's Disaster Recovery

At Celerant Technology, we know how critical communication is for retailers, especially during an emergency situation. This is why we take several precautions to provide our clients, and their data, with the security and protection they require. Celerant maintains an emergency generator, located at our main headquarters. In the event of a power outage, this generator supports clients' servers that are hosted by Celerant, to prevent loss of data and on-line availability during the outage.

OFFSITE HOSTING

Celerant's credit card servers and hosting servers are maintained at an offsite hosting facility. This state-of-the-art data center was built specifically to provide the perfect hosting environment. Some of the notable features provided by this facility include raised floors, full climate control, backup power generators, redundant backups, redundant high-speed internet connectivity (ensures 99.9% uptime), multi-point physical security.

AUTO PROTECT SECURITY

Celerant's Auto Protect service is both an off-site backup and an ongoing maintenance service that supports your advanced retail system with additional safety and reliability. With Auto-Protect, retailers can be assured that their management system is functioning at optimal performance levels all of the time.

As part of the Auto-Protect service provided by Celerant, your data is stored nightly on backup servers as well as portable data storage devices that are housed offsite at a secure facility. With Auto-Protect, retailers can be confident that their data is backed up, secure, and accessible if it is ever needed.
